APPENDIX

§10 Team Contribution — Individual section ownership and group collaborative contributions across all five team members.

§11 AI Use Statement — Generative AI tools used for brainstorming, drafting, design, and formatting, including Claude for report layout and PDF design.

KEY CONCLUSIONS

Stationery campaigns continue absorbing top-10 traffic at near-zero conversion. ConversionIQ synthesizes funnel KPIs weekly and surfaces drop-off anomalies before they compound.

Decision-support, not decision-maker. Every Tier 1 action — creator reassignment, campaign category change, partnership status — requires Frankie's written approval and independent source-system verification. ConversionIQ has zero write access to any system.

Adopt with conditions. A four-phase rollout — Pilot · Training · Go-live · Stabilize · Iterate — and 14 controls covering bias, privacy, hallucination, vendor risk, and overreliance gate full deployment.

SECTION 01

Five projects of measurement infrastructure — and the synthesis layer the agency never built.

Big Data, Bigger Bags is a creator-management and brand-partnership agency where engagement quality and audience behavior are valued over raw follower count. Projects 1 through 5 produced a measurement framework, an evaluation model, a CRM workflow, and a client-level funnel analysis. Project 6 is the synthesis.

PROJECT 01

Balanced Scorecard & KPI Framework

Established Engagement Rate, Repeat Viewer Rate, Revenue per 1,000 Views, Conversion Rate, and the composite Partnership Readiness Index across financial, creator, client, and process perspectives.

PROJECT 02

Tableau Creator Evaluation

Operationalized the Partnership Readiness Index thresholds — replacing subjective creator selection with KPI-driven prioritization for brand campaign assignment.

PROJECT 03

Salesforce CRM Workflow

Structured the brand-partnership lifecycle from intake through creator recommendation and execution, making every partnership decision traceable to a specific KPI evaluation.

PROJECTS 04–05

Google Merchandise Funnel Analysis

Applied the framework to a live engagement, exposing the 87.6% View → Cart drop-off, the 44.6% Checkout → Purchase drop-off, and zero-conversion Stationery and Stickers categories.

SECTION 02

Two specific decision failures, addressable now with infrastructure already paid for.

The responsible AI opportunity is narrow on purpose. ConversionIQ targets exactly two decisions Frankie makes every week — and refuses to expand its scope beyond them.

DECISION FAILURE 01

Delayed funnel visibility

The 87.6% View → Cart drop-off and 44.6% Checkout → Purchase drop-off identified in Projects 4–5 were discovered through retrospective analysis. By the time the pattern was visible in a static dashboard, the campaign had already underperformed. ConversionIQ synthesizes funnel KPIs weekly and surfaces drop-off anomalies before they compound.

DECISION FAILURE 02

Creator-to-product mismatch

Category-level data showed that Stationery / Stickers and Tumblers attracted high traffic but near-zero conversion. The agency had no systematic process for matching creator audience profiles to category conversion likelihood. ConversionIQ cross-references creator engagement profiles against category View-to-Buy rates to recommend optimal assignments.

SECTION 03

Two modes, one workflow. A scheduled brief and a bounded conversation.

ConversionIQ replaces Frankie's manual Monday review of three disconnected systems with a single AI-generated report delivered automatically each Monday at 8:00 AM, plus a follow-up chat that operates only on data already in that report.

MODE 1

Automated Monday Report

Pulls Tableau, Salesforce, and Google Analytics; processes against KPI baselines from Projects 1–5; delivers a structured written summary via email and Slack at 8:00 AM Monday.

MODE 2

Conversational Follow-up

After reading the report, Frankie can open the ConversionIQ chat to ask follow-up questions in natural language. The AI responds only using data in the current Monday report and connected source systems.

EXHIBIT 1 · MONDAY REPORT — STRUCTURED SECTIONS

**CREATOR PERFORMANCE
SNAPSHOT**

Every active creator flagged  /  /  against Project 2 thresholds.

CLIENT FUNNEL UPDATE

Stage and drop-off rates benchmarked against the 12.4% baseline.

REASSIGNMENT FLAGS

Creators whose assigned category is misaligned, with a one-line cause.

No speculation or causal claims beyond data scope. Every response prefixed with a source statement. Final reassignment authority remains with Frankie.

SECTION 04

Three sources, one Sunday-night sync window, one synthesized brief by 8:00 AM Monday.

ConversionIQ draws from three existing systems. No new data is collected; no data flows back into source systems automatically.

SOURCE 01 · TABLEAU CREATOR DASHBOARD — PROJECT 02

FIELD	DESCRIPTION
<code>creator_id</code>	Unique identifier for each active creator on the roster.
<code>engagement_rate</code>	Interactions divided by total reach, expressed as a percentage.
<code>repeat_viewer_rate</code>	Share of total views from returning audience members.
<code>revenue_per_1000_views</code>	RPM calculated from monetization data.
<code>conversion_rate</code>	Creator-attributed purchases divided by creator-attributed sessions.
<code>partnership_readiness_score</code>	Composite index from Project 2 thresholds; sub-threshold scores trigger an automatic flag.

DISCLOSURE · DATA QUALITY LIMITATION

Pilot benchmarks are derived from synthetic data and require recalibration.

The Google Merchandise Store dataset used in Projects 4 and 5 covers November 2020 through January 2021 and is synthetic. ConversionIQ's funnel benchmarks — including the 87.6% View → Cart drop-off — should be recalibrated against live client data once the system moves beyond the pilot phase. This limitation is disclosed in every Monday report footer.

SECTION 05

Fourteen ways this can go wrong — and the controls that keep it from doing so.

Every risk concept below is mapped to the ConversionIQ design, the actual roles on the Big Data, Bigger Bags team, and an operationally specific managerial control. None of the rows are template language.

EXHIBIT 3

Fourteen Responsible AI risks, mapped to ConversionIQ.

CONCEPT	RISK QUESTION	WHAT COULD GO WRONG	WHO IS AFFECTED	MANAGERIAL CONTROL
Strategic Alignment	<i>Does ConversionIQ support the business strategy established across Projects 1–5?</i>	The tool could be adopted because AI reporting is trending — not because it improves a specific decision Frankie makes weekly. If the Monday report repackages data Frankie already reviews without surfacing new patterns, it adds technical complexity without strategic value.	Frankie Velasquez; the full five-person team that built the underlying infrastructure; brand clients whose campaign performance depends on the quality of Frankie's weekly decisions.	Evaluated against three KPIs before deployment: (1) Stage Conversion Rate must show measurable improvement from 12.4% within two quarters; (2) Stationery / Stickers must show non-zero View-to-Buy within one quarter; (3) Frankie's Monday review time must decrease vs. manual baseline.
Data → Information → Decisions	<i>Is ConversionIQ using reliable, complete, and timely data?</i>	If any of the three systems fails to sync by Sunday night, the report delays Frankie's Monday window or generates with missing data. With an 87.6% View → Cart drop-off baseline, even a one-week delay in catching a worsening trend has measurable client impact.	Frankie Velasquez; brand clients whose campaigns can deteriorate within a single week; Deshan Liyanage, who owns pipeline maintenance.	The Monday report always generates on schedule regardless of completeness. Sections relying on incomplete data carry a RED confidence flag. Automated alert sent to Deshan by 7:00 AM Monday identifying affected fields. Monthly pipeline-failure log reviewed by the team.
Bias & Fairness	<i>Could ConversionIQ treat creators unfairly based on tenure or content niche?</i>	Newer creators may score below threshold simply because they lack enough weeks of data to build a reliable repeat_viewer_rate. Niche creators may show structurally lower engagement_rate than lifestyle creators despite higher conversion_rate per session.	Newer roster creators whose partnership_readiness_score is suppressed by data history; niche creators valuable for product-specific campaigns; Frankie, who may unknowingly act on biased recommendations.	Creators with <90 days tenure are excluded from automatic reassignment flags. Niche creators are evaluated against category-adjusted benchmarks rather than roster averages. Tyler conducts a quarterly bias audit comparing flag rates across segments.
Accuracy / Hallucination	<i>Could ConversionIQ generate authoritative-sounding summaries the data does not support?</i>	The AI could explain a declining engagement_rate by "reduced posting frequency" — a field that does not exist in the data — or characterize a one-week funnel spike as a sustained improvement against the 87.6% baseline.	Frankie Velasquez, whose primary decision input may contain fabricated explanations; active creators incorrectly flagged based on a misread trend; brand clients whose strategy may be adjusted based on an overstated summary.	Every claim is source-grounded. Each KPI section carries a data-citation footer. Causal claims are prohibited unless the cause exists in the source data. Trends require three consecutive weeks before being characterized as such. Tyler runs a monthly accuracy audit against five randomly selected report claims.
Transparency & Explainability	<i>Can Frankie and the team understand when a recommendation is AI-generated, what data it used, and why a flag fired?</i>	Clean, confident report language makes it easy to forget every summary was AI-generated. Frankie could act on a flag without knowing which KPI combination triggered it; the chat could respond with what sounds like human judgment without disclosing it is algorithmic.	Frankie Velasquez, who must defend every reassignment to creators, clients, and leadership; active creators who deserve to understand the basis of any decision affecting their partnership.	Every report opens with a standard AI disclosure. Every reassignment flag includes a one-sentence explainability summary identifying which KPIs and thresholds triggered it. Chat responses are prefixed with a source statement. Jesús maintains the decision log.
Technical Debt & Change	<i>Does fast-pilot adoption create long-term maintenance or governance problems?</i>	(1) Undocumented configuration concentrates knowledge in Deshan — a single point of human failure. (2) Untested edge cases cause silent report errors. (3) Scope creep — earnings forecasting, ROI projections — drifts the system beyond its original design.	Deshan Liyanage, disproportionately exposed without documentation; Frankie, disrupted by undocumented edge-case failures; Tyler, unable to audit effectively.	Four-phase implementation lifecycle. Full pipeline documentation completed by Deshan during weeks 5–6. No new features without Frankie's written approval and a governance impact assessment. Jesús logs all feature requests for quarterly review.

CONCEPT	RISK QUESTION	WHAT COULD GO WRONG	WHO IS AFFECTED	MANAGERIAL CONTROL
Misuse & Overreliance	<i>Could the team paste sensitive data into the chat or rely on the AI for decisions it was not designed to support?</i>	(1) A team member pastes contract terms, budgets, or PII into the chat, exposing data to the vendor. (2) Out-of-scope requests generate authoritative-looking outputs. (3) Sustained accuracy erodes Frankie's verification habit on Tier 1 decisions.	Frankie Velasquez, accountable regardless of in-scope vs. out-of-scope use; active creators and brand clients whose confidential data could be exposed via chat.	Acceptable Use Policy distributed before launch covering: permitted inputs (no raw creator data, financial info, contract terms, or PII in chat); permitted requests (only clarification of the current Monday report); verification requirements. Deshan reviews chat logs monthly.
Sustainability & Social Impact	<i>Does ConversionIQ create responsible long-term value — or introduce automation harm?</i>	(1) Creator relationship erosion — algorithmic flags become the perceived driver of partnership decisions. (2) Narrow metric optimization over-weights short-term conversion KPIs at the expense of qualitative signals. (3) Unnecessary compute during low-activity periods adds no decision value.	Active creators whose long-term agency relationships could be reshaped by algorithmic recommendations; brand clients whose strategies could over-optimize for short-term conversion; Frankie, balancing efficiency and qualitative judgment.	Standing rule: no creator reassignment is communicated based solely on a ConversionIQ recommendation — every conversation is preceded by a direct human discussion led by Frankie or Jorge. KPI framework reviewed annually. During low-activity weeks, ConversionIQ generates a simplified summary, not a full synthesis.
Source: Project 6 Risk Analysis · All risks and controls are specific to the ConversionIQ design. No template language.				

SECTION 06

ConversionIQ is a decision-support tool, not a decision-maker.

This plan ensures the system supports Frankie's weekly workflow without replacing human judgment or accumulating unmanaged risk.

Decision tiers

TIER 1 · FRANKIE APPROVAL REQUIRED

Creator reassignment · Campaign category change · Partnership status

TIER 2 · LOGGED BUT ACTIONABLE

Internal performance observations · Non-binding trend flags

Monitoring & data quality

Frankie must independently verify recommendations against Tableau engagement_rate, conversion_rate, and partnership_readiness_score before acting on any flag.

All Tier 1 approvals are logged by Jesús — date, action taken, source data reviewed. No Tier 1 decision is communicated to a creator or client until the log entry is complete.

Any team member may act on Tier 2 items but must log the action with Jesús by EOB Monday.

Frankie retains override authority on any Tier 2 item before it influences a Tier 1 decision.

Team responsibilities

Deshan Liyanage	Sunday-night sync confirmation; pipeline failure response; vendor uptime monitoring.
Tyler Chaffee	Monthly accuracy audit (5 random claims vs. raw source data); quarterly bias audit.
Jesús Gomez	Wednesday alignment check between Monday report and current Salesforce records; decision log; annual retention review each January.
Jorge Ramos	Review of all creator-identifiable flags before any creator conversation occurs.
Frankie Velasquez	Tier 1 decision owner; verification of all recommendations before action; override authority.

VENDOR OVERSIGHT

Vendor uptime and API availability monitored by Deshan. Any vendor outage that prevents Sunday-night synthesis triggers an automatic alert before 7:00 AM Monday. Vendor access reviewed annually. No vendor receives raw creator data; only aggregated KPI fields pass through the API.

SECTION 07

What the system says, what it refuses, and how it cites.

Every response ConversionIQ generates follows a designed structure: source disclosure first, data-constrained content second, Tier classification third.

EXHIBIT 4 · SAMPLE EXCHANGES

Three follow-up prompts and the source-cited responses ConversionIQ produces.

FRANKIE'S PROMPT	CONVERSIONIQ RESPONSE
"Which creators were flagged this week?"	Two creators were flagged this week. Creator A's partnership_readiness_score fell below the Project 2 threshold for the second consecutive week, driven by a repeat_viewer_rate decline from 34% to 21% and a conversion_rate of 0.4% against a category baseline of 2.3%. Creator B's engagement_rate dropped from 7.2% to 4.1% week over week. Both flags are based on Tableau data pulled Sunday night. Final reassignment decisions require your approval.
"What changed in the funnel?"	The View Item → Add to Cart rate moved from 12.4% to 11.8% this week, a decline of 0.6 percentage points against the Project 4–5 baseline. Stationery and Stickers continues to show a 0% View-to-Buy rate across 531 recorded views. Tumbler products remain below 1% conversion despite top-10 traffic volume. Source: Google Analytics funnel_stage export, week ending [date].
"Should I reassign this creator?"	This creator's partnership_readiness_score meets the Project 2 threshold, but their current campaign_category — Tumblers — has a View-to-Buy rate below 1% for three consecutive weeks. Based on Project 4–5 data, Jotter and Recycled Pen categories have consistently outperformed at 2.3–2.4% conversion. Reassignment may improve performance. This is a Tier 1 decision requiring your approval and independent verification before action is taken.

Source: ConversionIQ prompt design specification v1 · Examples reflect designed response style and source-citation requirements.

Refusal rules

ConversionIQ will reject these requests outright: **predicting creator earnings, campaign revenue, or audience growth** · **using data outside the connected systems** · **drafting creator contracts, client-facing reports, or campaign briefs** · **answering questions about creators not currently active in Salesforce CRM** · **presenting any recommendation as a final decision.**

SECTION 08

Pilot · Training · Go-live · Stabilize · Iterate.

Four phases gate full deployment. Each phase has defined participants, risk-reduction goals, and measurable success criteria before the next phase unlocks.

PILOT

Run in parallel with manual review

Weeks 1–4

ConversionIQ runs alongside Frankie's manual Monday review. The AI generates a report, but Frankie still completes his normal review of Tableau, Salesforce, and Google Analytics. The team compares AI output against Frankie's manual findings to test accuracy and usefulness.

SUCCESS CRITERIA

- ≥ 90% of AI report claims match source data
- Frankie's Monday review time decreases vs. manual baseline
- Major data sync issues identified before go-live

TRAINING

Documentation and team readiness

Weeks 5–6

Deshan completes full pipeline documentation. All team members complete acceptable-use training. Edge cases identified during Pilot — creator hiatus, mid-week campaign pauses, null funnel stages — are documented and tested before go-live.

SUCCESS CRITERIA

- Full pipeline documentation complete and reviewed
- All five team members complete acceptable-use training
- All Pilot edge cases documented and resolved

GO-LIVE

Retire manual review

Week 7

ConversionIQ becomes the official Monday reporting tool. The manual three-system review is retired as the primary process. Frankie still verifies any Tier 1 recommendation before action. Deshan remains on standby during the first four live Mondays.

SUCCESS CRITERIA

- Monday report delivered on time for four straight weeks
- No Tier 1 action without Frankie's written approval
- Salesforce and Tableau updates complete before next Sunday sync

ITERATE

Recalibrate & extend

Months 3–6

The team reviews performance results and decides what improvements to make: recalibrating funnel benchmarks against live data, improving category-level matching, adjusting bias controls for newer or niche creators. New features are only approved if they support the original purpose without scope creep.

SUCCESS CRITERIA

- Stage Conversion Rate moves from 12.4% toward 18% target
- Stationery / Stickers or Tumblers shows improved View-to-Buy
- Approved features carry documented business reason, governance impact, and data requirement

SECTION 09

Adopt with Conditions.

ConversionIQ solves a real business problem with infrastructure already paid for. It still needs human review, data controls, and Responsible AI safeguards before full launch.

BUSINESS VALUE CREATED

ConversionIQ reduces Frankie's manual review time, improves visibility into funnel drop-offs, identifies creator-to-product mismatches earlier, and helps the agency make more consistent, data-driven campaign decisions.

WHAT MUST BE TRUE BEFORE LAUNCH

Pilot must show $\geq 90\%$ of report claims match source data · all source systems must sync reliably · technical documentation must be complete · acceptable-use training completed by all team members · Frankie verifies all Tier 1 recommendations before action.

RISKS THAT REMAIN

Inaccurate AI summaries · missing or outdated data · overreliance on recommendations · privacy concerns · vendor risk · bias against newer or niche creators · scope creep beyond the original purpose.

WHY THIS RECOMMENDATION IS APPROPRIATE

Frankie currently has to manually review Tableau, Salesforce, and Google Analytics before making weekly creator and campaign decisions. ConversionIQ creates a faster, more consistent Monday report — but the conditions gate deployment against the most consequential risks identified in §05.

STOP / REDESIGN CONDITIONS — ANY ONE TRIGGERS A FULL TEAM REVIEW

- The system repeatedly produces recommendations not supported by underlying engagement_rate, funnel_stage, or partnership_readiness_score data.
- Stage Conversion Rate does not improve from the 12.4% baseline within two quarters of go-live.
- Unresolved data sync failures cause the Monday report to generate with red-flagged incomplete data for three or more consecutive weeks.
- The quarterly bias audit identifies systematic underrating of newer or niche creators that cannot be resolved through threshold recalibration.
- ConversionIQ is used to draft creator contracts, generate client-facing reports, or perform tasks outside its defined scope without a formal governance review and Frankie's written approval.

SECTION 10

Team roles and individual contributions.

Each team member owned specific sections of this report. The table below maps individual contributions to the sections they authored or co-authored, followed by the contributions made collectively as a group.

MEMBER	INDIVIDUAL CONTRIBUTIONS
Frankie Velasquez	§01 Led the business scenario framing and primary user identification.
	§01–06 Connected Projects 1–5 findings into a unified strategic narrative for Project 6.
	§02 Co-authored the Responsible AI Opportunity section identifying the two decision failures.
	§01–05 Defined the recurring managerial decisions and KPI continuity across all five prior projects.
	ALL Coordinated overall project direction and group communication throughout.
Deshan Liyanage	§03 Designed the ConversionIQ two-mode workflow.
	§04 Specified all data sources, fields, sync schedules, and quality controls.
	§05 Led the full Responsible AI Risk Analysis Table, customizing all 14 rows to the ConversionIQ scenario.
	§04 Defined the data pipeline from source systems through the AI engine to the Monday report output.
	§04 Authored the data quality limitation disclosure and field-level exclusion rules.
Tyler Chaffee	§01 Assisted with the KPI table, key insights from each prior project, and strategic theme.
	§02 Assisted with business problem framing, why existing tools are insufficient, and target KPI improvement goals.
	§11 Authored the AI Use Statement.
	§03 Contributed to alignment between the scenario narrative and the ConversionIQ design concept.
	ALL Reviewed and refined written sections for clarity and consistency.
Jorge Ramos	§06 Built the full Governance and Controls Plan including decision tiers, access controls, monitoring, vendor oversight, and issue handling.
	§07 Authored the Prompt and Interaction Design including the two-step interaction model, approved prompts, example responses, prohibited requests, and guardrail language.
	§06 Designed the tiered access model restricting report distribution by role.
	§06 Defined system boundaries specifying what ConversionIQ can and cannot do.
	§06 Established the escalation and incident response procedures.
Jesús Gomez	§08 Authored the Adoption and Rollout Plan including all five phases with risks, measures of success, and team responsibilities.
	§09 Authored the Final Recommendation including the adopt-with-conditions decision, business value summary, remaining risks, launch requirements, and stop/redesign conditions.
	§08–09 Connected rollout phase success measures back to the KPI targets established in Section 2.
	§09 Defined the conditions under which ConversionIQ deployment would be paused or redesigned.

GROUP COLLABORATIVE CONTRIBUTIONS

- Developed the ConversionIQ concept, name, and two-mode design as a team.
- Defined the target KPIs and success benchmarks used across all sections.
- Reviewed and aligned all sections to ensure consistency across the full report.
- Connected all design decisions back to specific findings from Projects 1–5.

SECTION 11

How generative AI tools were used in this project.

Our team used generative AI tools to support brainstorming, drafting, refining written content, and producing the professional design and formatting of this report throughout the project.

Content and writing support

AI was used to support the following content tasks:

- Strengthen the Scenario Continuity section by helping structure the narrative connecting Projects 1–5 to the ConversionIQ design.
- Refine the Responsible AI Opportunity section, including the framing of the two decision failures and the target KPI improvement goals.
- Improve the clarity and organization of written explanations across multiple sections.

Representative prompts included: *"Suggest ways to explain why existing dashboards are not enough for this use case,"* and *"Refine this KPI table for clarity and consistency."*

Report design and formatting

AI was also used to design and produce the professional layout, typography, and formatting of this report. Specifically:

- **Claude (Anthropic)** was used to design and generate this entire report's visual system — including the A4 print layout, color palette, typography hierarchy, section structure, table formatting, exhibit frames, and PDF rendering.
- The McKinsey × Linear design system referenced in the report formatting was developed and applied using Claude's design and code generation capabilities.
- Claude converted the report from HTML to a fully formatted, print-ready A4 PDF with correct page breaks, margins, and background color rendering.
- All design decisions — navy slabs, cobalt accent, exhibit labels, two-column body layout, stat callout rows — were implemented through iterative Claude prompting and refinement by the team.

Important clarification: All AI outputs were reviewed, revised, and adapted by team members to ensure alignment with our specific business scenario. ConversionIQ design, data sources from Projects 1–5, and course requirements were all verified by our team before being used in the project. AI was not used to generate final answers without team review. No AI tool made analytical decisions, selected KPIs, or determined risk controls on behalf of the team — those judgments were made by the group or independently by our members and reflect our own project work. The report design and PDF formatting produced by Claude were directed by the team and reviewed for accuracy and alignment before submission.

A Monday brief, governed by humans, owned by Frankie.

Prepared as the Project 6 capstone for Big Data, Bigger Bags. ConversionIQ proceeds to Pilot pending vendor selection and Frankie's go-ahead.
